AMENDMENT TO THE CLAIMS:

Claims pending

- At time of the Action: Claims 13, 29, 45 and 49-53.
- After this Response: Claims 13, 29, 45 and 49-53.

Canceled or Withdrawn claims: None.

Amended claims: Claims 13, 29, 45, 51, and 53.

New claims: None.

This listing of claims will replace all prior versions, and listings, of claims in the application:

Claims 1-12 (canceled)

Claim 13 (currently amended): A method for encoding a motion video signal, the method comprising:

comparing first and second frames of the motion video signal to one another to determine an absolute pixel difference between the first and second frames;

determining, based at least in part on the absolute pixel difference, whether the second frame represents a scene change in a motion video image represented by the motion video image;

encoding the second frame as an independent frame upon a condition in which the second frame represents the scene change in the motion video image; and

12

15

18

25

LER & HAVES, PLIA

encoding the second frame as a motion-compensated frame upon a condition in which the second frame does not represent the scene change in the motion video image.

Claims 14-28 (canceled)

Claim 29 (currently amended): A computer readable medium useful in association with a computer which includes a processor and a memory, the computer readable medium including computer instructions which are configured to cause the computer to encode a motion video signal by performing the steps of: comparing first and second frames of the motion video signal to one another to determine an absolute pixel difference between the first and second frames;

determining, based at least in part on the absolute pixel difference, whether the second flame represents a scene change in a motion video image represented by the motion video image;

encoding the second frame as an independent frame upon a condition in which the second frame represents the scene change in the motion video image; and

encoding the second frame as a motion-compensated frame upon a condition in which the second frame does not represent the scene change in the motion video image.

Claims 30-44 (canceled)

Claim 45 (currently amended): A computer system comprising: a processor;

13

19

17

22

a memory operatively coupled to the processor; and

a motion video signal encoder which executes in the processor from the memory and which, when executed by the processor, causes the computer system to encode a motion video signal by performing the steps of:

comparing first and second frames of the motion video signal to one another to determine an absolute pixel difference between the first and second frames;

determining, based at least in part on the absolute pixel difference, whether the second frame represents a scene change in a motion video image represented by the motion video image;

encoding the second frame as an independent frame upon a condition in which the second frame represents the scene change in the motion video image; and

encoding the second frame as a motion-compensated frame upon a condition in which the second frame does not represent the scene change in the motion video image.

Claims 46-48 (canceled)

Claim 49 (previously presented): A computer readable medium comprising instructions which, when executed by a computer, performs the method of Claim 13.

Claim 50 (previously presented): The method of claim 13 wherein the determining

whether the second frame represents a scene change comprises:

measuring a difference between the first and second frames;

comparing the difference to a predetermined threshold;

determining that the second frame represents the scene change if the difference is greater than the predetermined threshold; and

determining that the second frame does not represent the scene change if the difference is not greater than the predetermined threshold.

Claim 51 (currently amended): The method of Claim 50 wherein the difference is an absolute pixel difference the absolute pixel difference between the first and second frames is an average of an absolute value of a difference of each pair of corresponding pixels between the first and second frames.

Claim 52 (previously presented): The computer readable medium of Claim 29 wherein the determining whether the second frame represents a scene change comprises:

measuring a difference between the first and second frames;

comparing the difference to a predetermined threshold;

determining that the second frame represents the scene change if the difference is greater than the predetermined threshold; and

determining whether the second frame does not represent the scene change if the difference is not greater than the predetermined threshold.

Claim 53 (currently amended): The computer readable medium of Claim 52

24

25

wherein the difference is an absolute pixel difference the absolute pixel difference between the first and second frames is an average of an absolute value of a difference of each pair of corresponding pixels between the first and second frames.
